How do I access critical business information anytime and anywhere in a secure reliable way in order to maintain productivity and achieve operational efficiency?

The pressure on organisations to secure and access business critical systems and corporate information has intensified with the recent growth in mobile working and unified communication requirements, technological advances and regulatory compliance to restrict access to private information.

Organisations at every level require strong, reliable authentication and network access mechanisms that support workflow and routine business processes without compromising security. Online environments for partner and consumer access must be trusted and trustworthy. In fact, Gartner suggest that "Through 2009, establishing adequate third-party security and privacy safeguards will be the greatest challenge facing CISOs and privacy officers"

The Solution

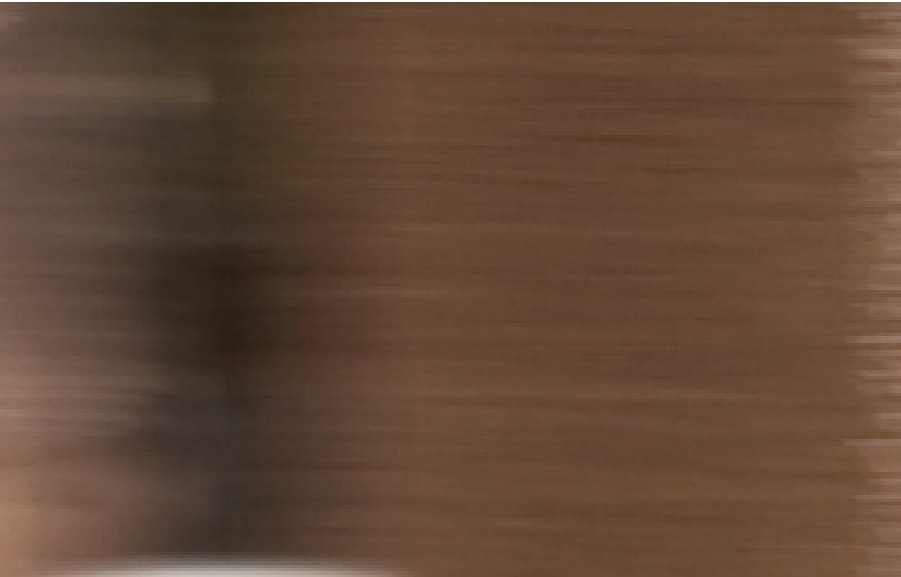

With RSAAccelerateIT, we can help you reduce costs by up to 30% on secure access to sensitive information from your networks, with 24x7 support! Our security specialists can advise and integrate the latest RSA SecurID® technologies and software updates to make sure your organisation can benefit from collaborative working and accelerate

business decisions between your employees, business partners and customers and readily access sensitive corporate information.

Our Enterprise Managed Services division, accredited RSA SecurCare provider, can provide 24x7 support to take away the burden of security administration to reduce costs and release manpower.

The RSA SecurID® solution fits into a number of organisational environments:

- **Virtual Private Networks (VPNs):** Organisations that are using or plan to deploy Virtual Private Networks. While the encryption employed by VPN helps protect data being transferred over the internet, strong authentication is also required to validate user identities.
- **Web Applications:** With more organisations relying on web services to transact business, interact with customers and extend public access to information, a proven mechanism is required to prevent unauthorised access to sensitive information. Organisations relying on web applications validate each user's identity before granting access to vital data.
- **Wireless LANs:** The increased use of mobilised applications and wireless computing devices presents another potential security risk. Unauthorised users can easily connect through wireless access points. This type of intrusion can compromise sensitive data within the organisation.

- **Citrix® Thin Clients:** Thin-client architectures, such as Citrix® technologies, centralise application use, requiring users to sign on to a server to gain access.
- **Secure Email Access:** Email represents an essential communication medium for most organisations, but the threat of messages being stolen, falsified or misdirected must be effectively countered.

The Options

A flexible and adaptable organisation built on family values, we get things done. Our 'can do' attitude means customers enjoy the best of both worlds - breadth and depth of capability and European coverage delivered by people who make decisions and simply get on with it.

With RSAAccelerateIT we can provide the following SecurID® solutions:

Licence

The RSA Authentication Manager (formerly known as Ace/Server) licence is based on number of users and is scalable to several thousand users. Predominantly software based but also available as an appliance for smaller rollouts (100 user max).

RSA SecurID Authenticator (token, keyfob)

Available in hardware, software and smart card formats, authenticators are adaptable to several device types and platforms. It combines a PIN with a token that generates a new code every 60 seconds for rigorous two-factor authentication.

Support

For the RSA Authentication Manager licence this is based on the same user count as the licence. We will be offering the first and second line support in-house as a service.

Other elements to note also include:

RSA Authentication Agents software: Stands between a user and a protected resource to enforce two-factor authentication. Works effectively with Remote Access Servers (RAS), firewalls and Virtual Private Networks (VPNs), ensuring integration with any customer environment.

RSA Authentication Manager software: Administers users and tokens, setting and enforcing security policies and protecting access to private network systems, files and applications. It offers a flexible and highly interoperable administration tool that works with over 300 vendor products from nearly 200 partners.

Supporting Services

- Accredited as one of RSA's leading Solutions Partners and SecurCare providers
- Our engineers are trained and certified to the same level as RSA
- We have expertise in implementing ITIL practices, as evidenced by our ISO 20001 accreditation
- We have technical expertise and support needed to maximise the security and availability of customers' business critical information using RSA solutions
- With our dedicated test lab facility we can exactly replicate the customer environment to provide comprehensive support
- Our Managed Services' RSA practice delivers an environment in which interactions, information and infrastructure are protected, efficient, compliant and resilient for customers
- With our Enterprise Support services
 - We have unlimited and direct access to vendor technical resources, enabling us to act as a single point of contact for all enterprise related incidents
 - We are the infrastructure experts and know the installation history, enabling better SLA's for customers
 - Highly experienced with a wide range of infrastructure both in hardware and software, which fast tracks us to diagnosing the issue

Key Benefits

- Up to 30% reduced security and support costs
- Authenticated users can use RSA tokens whether local, remote or mobile with secure access anywhere and anytime to readily access sensitive corporate information
- Optimise collaborative working and accelerate business decisions between employees, business partners and customers
- Enhanced compliance with effective tracking and reporting for who accessed what
- Increase user efficiency by eliminating user frustration and lost productivity associated with passwords
- Connect key internal and external stakeholders for business enablement
- Strengthens security by utilising industry best practices to validate user identities and access
- Protect:
 - Private data, such as patient records, financial information and order-processing data
 - Unmanaged devices and locations for remote access, such as airport and hotel kiosks, laptops, blackberry devices, smartphones etc...

Managed Services

Improved cost management and business efficiency – Achieve up to 30% reduced IT costs associated with user password administration and securely support remote office initiatives.

Improved visibility and predictability – Enhanced compliance with effective tracking and reporting for who accessed what and when. Also increases collaborative working to accelerate decision making and enhance engagement.

Improved environmental impact – Fundamentally you can have an immediate and sustainable impact by using RSA tokens to accelerate mobile working initiatives, which reduces the need to travel and subsequently reduces your carbon footprint.

Capacity – Minimise security administration and support both in facilities and manpower to focus on core business activities.

Key Facts

- €3.5+ billion turnover
- Best of breed technology solutions provider
- Over 35 years of sustainable, profitable growth
- Over 7,000 customer focussed employees
- Real capability in deploying and supporting European technology
- Integrated service model including onshore, nearshore and offshore
- Strong regional presence across 10 European countries
- Over 5,000,000 users supported across Europe
