

Cisco Threat Analyzer for Office 365

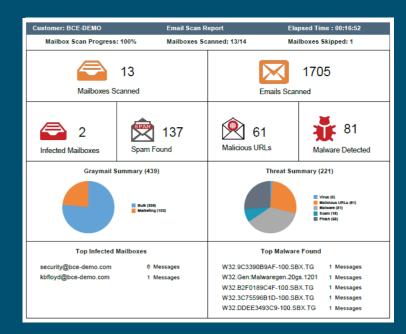

Identify threats within your Office 365 Email

The Cisco Threat Analyzer for Office 365 is an assessment tool that quickly identifies security gaps within Office 365 email inboxes. It can find security vulnerabilities present in mailboxes and expose whether the threats are malware, malicious URLs, spam or graymail. The tool can also identify detailed information about potential malware, whether it has the potential to be a phishing attack, is a virus or spam that could be malicious. The tool can also help identify security threats that were allowed into your environment which may contain malicious URLs, phishing, graymail or graymail.

The Cisco Threat Analyzer for Office 365 operates in scan mode only, it does not read emails and scanned information is discarded once the scan is completed. The scan simply identifies further areas that should be investigated and highlights how many infected inboxes have been found and the potential threats.

Find Your Security Blindspots with the Cisco Threat Analyzer for Office 365
