

Managed

Organisations need to detect and triage breaches before they can cause damage. But, this leads to huge volumes of logs and alerts across a customer's infrastructure which can be difficult to manage.

At SCC, our Managed Security practice delivered from our Security Operations Centre provides security analytics with real-time monitoring and improved capabilities to detect and prevent cyber attacks.

We can help reduce your spend on security management, while offering you resilient protection. Using the most advanced tools and technologies to detect malicious activity, we significantly reduce time to detection and improve capabilities to stop potential attacks.

Our Managed Security service can be an important piece of your strategy that allows us to monitor your systems and infrastructure. In the constant fight against cyber crime and insider threats, SCC delivers our managed service to keep you ahead of the curve, protecting your data and most valuable information assets.

Cyber Security Service

Our Cyber Security Service (CSS) is powered by a next generation Security Information and Event Management (SIEM) platform that integrates and consolidates information from different sources, including infrastructure log correlation, threat intelligence feeds and advanced data analytics techniques.

Delivered from our UK-based security operations centre, our service is an intelligence-led approach for protecting your most valuable information assets. Features of CSS include:

- Integration of log sources from a range of customer environments
- Proactive security alerts and reports provided by a team of security analyst and professionals
- Detailed analysis and management of threats as they impact your IT network
- Management of the complexity around cyber security
- Managed firewall service.

Why partner with SCC?

SCC offers a Managed Security service that enhances the protection of your network, systems and infrastructure. Working within your budget, we provide an effective risk management solution, offering resilient protection.

Key Benefits

- Pro-active monitoring to reduce the risk of cyber attacks and other security breaches
- Effective management of logs, events, alerts and alarms across a range of log sources
- Achieve the right level of compliance to protect your brand, reputation and improve productivity
- Reduced cost of security monitoring and risk management.
