IBM Process Mining & IBM Blueworks Live

Five reasons to combine IBM® Process Mining capabilities with IBM Blueworks Live

IBM Process Mining uses business system data to give you insights on how your processes are performing and how to optimize them to achieve greater ROI by eliminating inefficiencies and identifying improvement opportunities, like automation. With a trade-up to include IBM Process Mining, you get end-to-end process visibility to augment the work you do in IBM Blueworks Live for faster process improvements that guarantee ROI. Here are five reasons to make the move.

Design optimal processes with simulation

Use a design thinking approach to model new processes. Import models from IBM Blueworks Live into the IBM Process Mining simulation tool to test projected performance and expected ROI outcomes. Modify your models based on the simulated results to guarantee your new processes will be efficient from the moment you implement them into your operations.

Test change initiatives before implementation

Test process improvements on your existing IBM Blueworks Live models. Change your models based on process scenarios that eliminate process gaps, increase future performance, hit KPIs, and boost ROI with confidence that your changes will improve customer experience without negatively impacting the process downstream or the stakeholders involved.

Discover the best performers in your process

Analyze process deviations and uncover why processes follow a specific path. Find which process paths give you the best time and costs. Then, enhance your existing process models in IBM Blueworks Live to incorporate changes for process improvement.

Validate your processes

Understand if your process documentation captures how your processes are really performing. Compare IBM Blueworks Live process models with process flows modeled from system data in IBM Process Mining for accurate, objective analysis. Conduct regular audits and check the compliance of your activities to quickly uncover risks and increase process governance.

Get process updates to protect the business against threats

Keep your process models up to date with your most recent data to reflect current process performance. You and your team can carry out regular analyses on your IBM Blueworks Live process models and react quickly to unexpected process behavior, like bottlenecks and deviations. Continuously monitor your processes and attain operational alignment across the entire business.

Take advantage of these process mining capabilities to improve processes more effectively across your organization.
